

47 μ F AC-Coupling Capacitor Low Voltage Video Driver with LPF

■GENERAL DESCRIPTION

The **NJM2512A** is a Low Voltage Video Amplifier featuring small AC-coupling Capacitor.

The NJRC original Technology "ASC(Advanced SAG Correction)" realizes 47 μ F AC-Coupling Capacitor which enables to downsize mounting space.

No worrying about beat noise caused by charge-pump circuit, and over-current caused by circuit short out than Capacitor-less video driver.

The **NJM2512A** is suitable for any video application.

NJM2512: Gain=6dB

NJM2512A : Gain=12dB

■PACKAGE OUTLINE

NJM2512ARB1

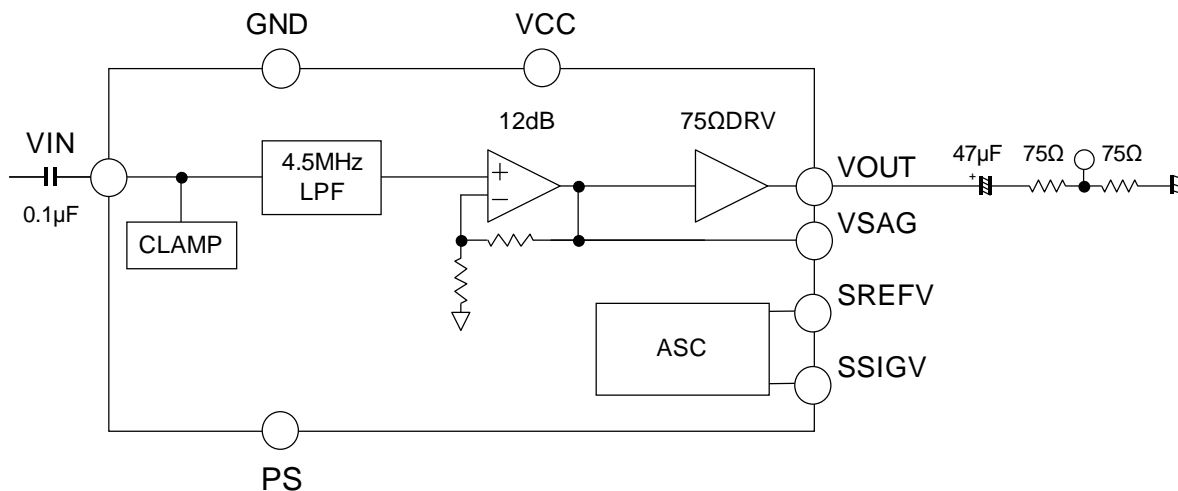

■FEATURES

- Operating Voltage 3.0 to 5.5V
- AC-Coupling capacitor 47 μ F
- 6dB Amplifier
- 75 Ω Driver
- Internal LPF 0dBtyp.at 4.5MHz
 -33dBtyp.at 19MHz
- Power-save Circuit
- Bipolar Technology
- Package Outline TVSP8

■PIN CONNECTION

■BLOCK DIAGRAM

■ABSOLUTE MAXIMUM RATINGS (Ta=25°C)

| PARAMETER | SYMBOL | RATINGS | UNIT |
|-----------------------------|------------------|-------------|------|
| Supply Voltage | V ⁺ | 7.0 | V |
| Power Dissipation | P _D | 580(Note1) | mW |
| Operating Temperature Range | T _{opr} | -40 to +85 | °C |
| Storage Temperature Range | T _{stg} | -40 to +150 | °C |

(Note1) At on a board of EIA/JEDEC specification. (114.3 x 76.2 x 1.6mm Two layers, FR-4)

■RECCOMENDED OPERATING CONDITIONS (Ta=25°C)

| PARAMETER | SYMBOL | TEST CONDITION | MIN. | TYP. | MAX. | UNIT |
|-------------------|------------------|----------------|------|------|------|------|
| Operating voltage | V _{opr} | | 3.0 | - | 5.5 | V |

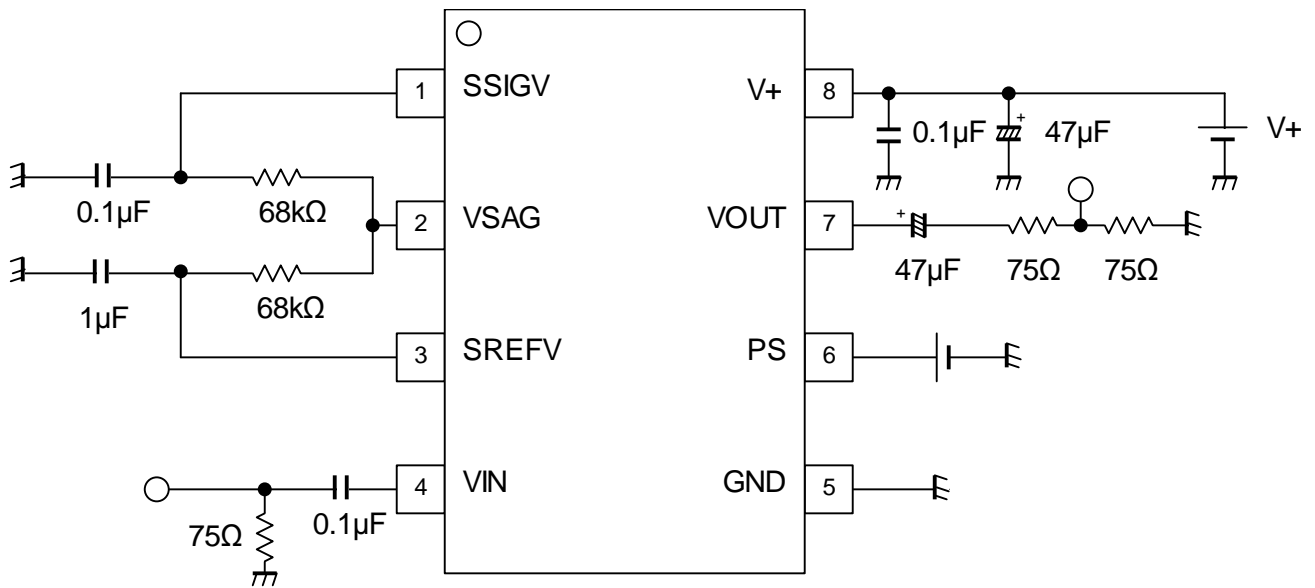

■ELECTRICAL CHARACTERISTICS (V⁺=3.3V, R_L=150Ω, Ta=25°C)

| PARAMETER | SYMBOL | TEST CONDITION | MIN. | TYP. | MAX. | UNIT |
|-----------------------------------|--------------------|---|------|------|----------------|------------------|
| Supply Current | I _{cc} | No signal | - | 10 | 15 | mA |
| Supply Current at Power Save Mode | I _{save} | No signal , Power save mode | - | 20 | 50 | μA |
| Maximum Output Level | V _{om} | V _{IN} =100kHz, sin-signal, THD=1%, | 2.2 | - | - | V _{p-p} |
| Voltage Gain | G _v | V _{IN} =1MHz, 1.0V _{p-p} sin-signal | 11.5 | 12.0 | 12.5 | dB |
| Low Pass Filter Characteristic | G _{f4.5M} | V _{IN} =4.5MHz/1MHz, 0.5V _{pp} sin-signal | -0.6 | -0.1 | +0.4 | dB |
| | G _{f19M} | V _{IN} =19MHz/1MHz, 0.5V _{pp} sin-signal | - | -33 | -23 | dB |
| Differential Gain | DG | V _{IN} =0.5V _{p-p} 10step video signal | - | 0.5 | - | % |
| Differential Phase | DP | V _{IN} =0.5V _{p-p} 10step video signal | - | 0.5 | - | deg |
| S/N Ratio | SN | V _{IN} =0.5V _{p-p} , 100kHz to 6MHz, 100% White Video Signal, R _L =75Ω | - | 60 | - | dB |
| SW Voltage High Level | V _{thH} | Active | 1.8 | - | V ⁺ | V |
| SW Voltage Low Level | V _{thL} | Non-Active | 0 | - | 0.3 | V |
| SW Sink Current High Level | I _{thH} | V=3V | - | - | 300 | μA |
| SW Sink Current Low Level | I _{thL} | V=0.3V | - | - | 5 | μA |

■ CONTROL TERMINAL

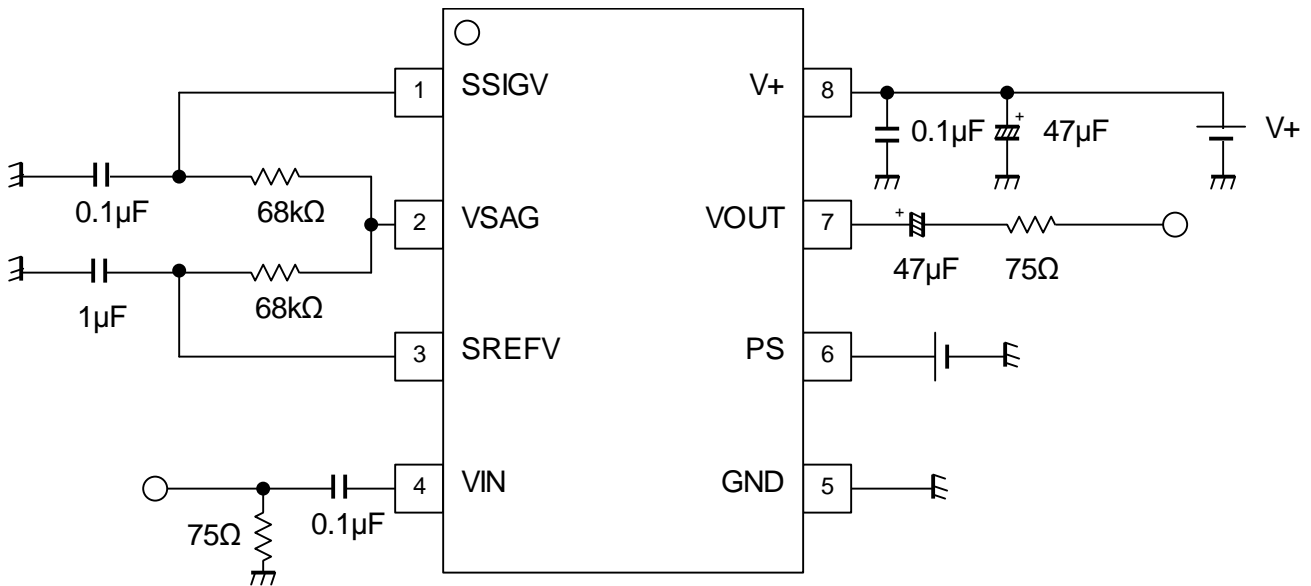

| PARAMETER | STATUS | MODE |
|------------|--------|---------------------------------------|
| Power Save | H | Power save: OFF Active mode |
| | L | Power save: ON Non-Active mode (Mute) |
| | OPEN | Power save: ON Non-Active mode (Mute) |

■ TEST CIRCUIT

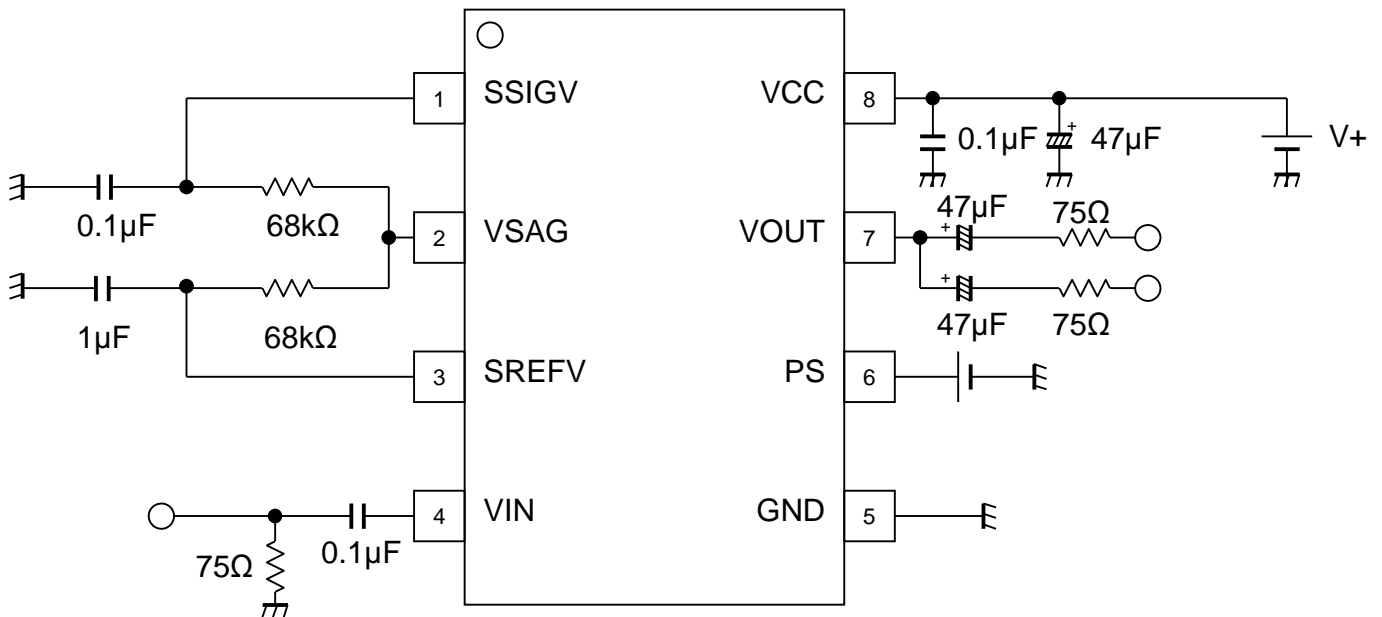

NJM2512A

APPLICATION CIRCUIT1

APPLICATION CIRCUIT2 (2-line drive)

APPLICATION NOTE

NJM2512A has possibilities that decrease in the capacitance in low-frequency band when the ceramic capacitor is used (pin 7). It is a possibility that the sag is generated when the ceramic capacitor decreases capacity. Please verify it in consideration of the capacity drop of the ceramic capacitor.

◆ **Clamp circuit**

1. Operation of Sync-tip-clamp

Input circuit will be explained. Sync-tip clamp circuit (below the clamp circuit) operates to keep a sync tip of the minimum potential of the video signal. Clamp circuit is a circuit of the capacitor charging and discharging of the external input C_{in} . It is charged to the capacitor to the external input C_{in} at sync tip of the video signal. Therefore, the potential of the sync tip is fixed.

And it is discharged charge by capacitor C_{in} at period other than the video signal sync tip. This is due to a small discharge current to the IC.

In this way, this clamp circuit is fixed sync tip of video signal to a constant potential from charging of C_{in} and discharging of C_{in} at every one horizontal period of the video signal.

The minute current be discharged an electrical charge from the input capacitor at the period other than the sync tip of video signals. Decrease of voltage on discharge is dependent on the size of the input capacitor C_{in} .

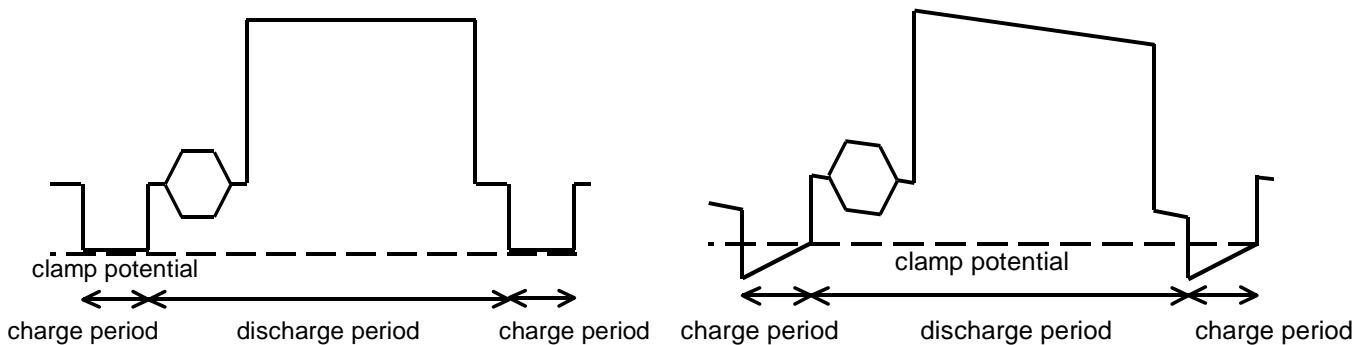

If you decrease the value of the input capacitor, will cause distortion, called the H sag. Therefore, the input capacitor recommend on more than 0.1 μ F.

< Clamp circuit >

A. C_{in} is large

B. C_{in} is small (H sag experience)

< Waveform of input terminal >

2. Input impedance

The input impedance of the clamp circuit is different at the capacitor discharge period and the charge period.

The input impedance of the charging period is a few $k\Omega$. On the other hand, the input impedance of the discharge period is several $M\Omega$. Because is a small discharge-current through to the IC.

Thus the input impedance will vary depending on the operating state of the clamp circuit.

3. Impedance of signal source

Source impedance to the input terminal, please lower than 200Ω . A high source impedance, the signal may be distorted. If so, please to connect a buffer for impedance conversion.

[CAUTION]

The specifications on this databook are only given for information, without any guarantee as regards either mistakes or omissions. The application circuits in this databook are described only to show representative usages of the product and not intended for the guarantee or permission of any right including the industrial rights.
