OUTPUT COUPLING CAPACITOR-LESS
VIDEO AMPLIFIER WITH COAXIAL COMMUNICATION RECEIVER

■ GENERAL DESCRIPTION

The NJU71042 is a Low Voltage Video Amplifier with Coaxial Communication Receiver. By the internal charge pump circuit, output capacitor is unnecessary.

The NJU71042 features low power and small package, and is suitable for low power design on downsizing of portable video system and system with video output.

Moreover, the following voltage gain variations are arranged.
 - NJU71041(Gain=6dB)

■ FEATURES
- ● Operating Voltage   2.5 to 3.45V
- ● Output coupling capacitor-less
- ● Coaxial Communication Receiver
- ● 12dB amplifier
- ● Internal 75Ω Driver Circuit (2-system drive)
- ● Internal LPF   -1dB at 10MHz typ
                          -40dB at 54MHz typ
- ● CMOS Technology
- ● Package Outline   MSOP10(TVSP10)*, EQFN12(3.0*3.0mm)**U.D.
              *MEET JEDEC MO-187-DA / THIN TYPE

■ Application Note

• The UTC receiver block (UTCIN (pin6), UTCOUT (pin5), UTCREF (pin4))

The NJU71042 can transmit that video signal and camera control signal at one coaxial cable.

The output video signal from the NJU71042 superimposes on a camera control signal (a coaxial data from an output unit).

The output unit examples are DVR, camera-controller, and so on.

The superimposed signal is inputted to the NJU71042 UTCIN (pin 6). Refer to fig1.

The signal inputted to UTCIN (pin6) is compared to the reference voltage generated by the NJU71042.

After that, it is amplified and outputted the high (V+)/low (0V) signal from UTCOUT (pin5).

(The UTCREF (pin4) can set the threshold voltage of the comparator by the pull-down or the pull up resistor. Refer to fig3.)

The signal outputted from UTCOUT (pin5) is inputted to a camera control block of CCTV.

As above mentioned, the video signal and the camera control signal can transmit at one coaxial cable. Therefore, The NJU71042 contributes to the space - saving.

A case of multiple coaxial transmission: UTC(Up The Coaxial)

This is one of a case at the multiplex coaxial transmission used in CCTV.

It is a system that control signals of camera multiplexing to the coaxial cable.

This system is superimposed on the control signal pulse in the vertical blanking period as shown in Figure.

This is because do not affect the video signal.

• **Application flow about the UTC receiver of the NJU71042**

1. The output-signal from VOUT (pin7) superimposes a camera control signal by a camera control unit.
   (The superimposed signal is inputted to the camera output block.)
2. The superimposed signal is inputted to UTCIN (pin6).
3. Its signal is clamped on sync-tip to reference voltage.
4. The clamped signal is amplified two times. After that, its signal is passed through comparator, and converted to high level (V+) or low level (0V). And then, the converted signal is outputted from UTCOUT (pin5).
5. The outputted signal from UTCOUT (pin5) is inputted to CCTV' s camera control unit.

Note) The control signal cannot use 2-system drive. Refer to Fig2.
