■ TERMINAL INFORMATION

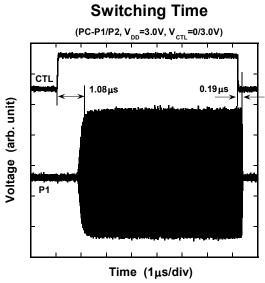

No.	SYMBOL	DESCRIPTION
2	P2	This port is connected to PC port by applying the control voltage $0\sim+0.4$ V(V _{CTL(L)}) to 14th pin. An external capacitor is required to block the DC bias voltage of internal circuit.
6	PC	Common RF port. This PC port is connected to P1 or P2 by logical control voltage of 14th pin. In order to block DC bias voltage of internal circuit, an external capacitor is required.
10	P1	This port is connected to PC port by applying control voltage of $+1.3 \sim +4.5 \text{ V (V}_{\text{CTL(H)}})$ to 14th pin. An external capacitor is required to block the DC bias voltage of internal circuit.
12	VDD	A supply voltage terminal (+2.0~+4.5 V). Place a bypass capacitor between this terminal and ground plane for avoiding RF noise from outside.
14	CTL	Control signal input terminal. This terminal is set to High-Level (+1.3~+4.5 V) or Low-Level (0~+0.4 V).
1,4,8,11	NC (GND)	No connected terminal. This terminal is not connected with internal circuit. Connect to the PCB ground plane.
3,5,7, 9,13	GND	Ground terminal. Connect this terminal with ground plane as close as possible for excellent RF performance.

PRECAUTIONS

- The DC blocking capacitors have to be placed at RF terminal of PC, P1 and P2.
- [1] [2] For good RF performance, the ground terminals must be placed possibly close to ground plane of substrate, and through holes for GND should be placed near by the pin connection.
- Bypass capacitor (C4) should be placed close to terminal of VDD to reduce stripline influence of [3] RF characteristics.
