

## UTRS485

CMOS IC

### FAIL-SAFE, 4.5MBPS, RS-485 / RS-422 TRANSCEIVERS WITH $\pm 12KV$ ESD-PROTECTED

#### DESCRIPTION

The UTC **UTRS485** is a half-duplex transceiver designed for RS-485 data bus network, which contains one transmitter and one receiver. The UTC **UTRS485** features a fail-safe receiver, which guarantees the receiver to output high when the receiver inputs are open.

The UTC **UTRS485** also features a hot-swap glitch free protection circuits which guarantee outputs of both the transmitter and the receiver in a high impedance state during the power up period. So that the large short current from power to ground will be disabled by glitch free function, which will save the power and enhance the efficiency of the power up.

The UTC **UTRS485** is optimized for signal rates up to 4.5Mbps with differential voltage of 2.3V. The UTC **UTRS485** also has the thermal shutdown function when the temperature is over 150°C and the protection of the current limitation in the transmitter to protect the itself from the damage by the system-fault conditions during normal operation.

#### FEATURES

- \* Meet the requirements of the EIA/TIA-485 standards.
- \* 5.0V single power supply.
- \* True fail-safe receiver while maintaining EIA/TIA-485 compatibility.
- \* Hot-Swap glitch free protection on control inputs.
- \* Up to 32 transceivers on the bus.
- \* Driver short circuit current limit.
- \* Thermal shutdown for overload protection.

## MARKING

## PIN CONFIGURATION

## PIN DESCRIPTION

PIN NO.	PIN NAME	DESCRIPTION
1	RO	Receiver output: if $A > B$ by 200mV, RO will be high; if $A < B$ by 200mV, RO will be low.
2	$\overline{RE}$	Receiver output enable. RO is enable when $\overline{RE}$ is low; RO is high impedance when $\overline{RE}$ is high.
3	DE	Driver output enable. The driver outputs, Y and Z, are enabled by bringing DE high. They are high impedance when DE is low. If the driver outputs are enabled, the parts function as line drivers. While they are high impedance, they function as line receivers if $\overline{RE}$ is low.
4	DI	Driver Input. A low on DI forces output Y low and output Z high. Similarly, a high on DI forces output Y high and output Z low.
5	GND	Ground
6	A	Non-inverting receiver input and non-inverting driver output
7	B	Inverting receiver input and inverting driver output
8	$V_{CC}$	Positive supply; $4.75V \leq V_{CC} \leq 5.25V$

## ■ ABSOLUTE MAXIMUM RATING

PARAMETER	SYMBOL	RATINGS	UNIT
Supply Voltage	$V_{CC}$	7.0	V
Control Input Voltage ( $\overline{RE}$ , DE)		$V_{CC}$	V
Driver Input Voltage (DI)	DI	$V_{CC}$	V
Driver Output Voltage (A, B)		$\pm 12.5$	V
Receiver Input Voltage (A, B)		$\pm 12.5$	V
Receiver Output Voltage (RO)		$V_{CC}$	V
Continuous Power Dissipation (Derate 5.88mW/°C above +70°C)	DIP-8	$P_D$	550
	SOP-8		471
Operating Temperature Ranges	$T_{OPR}$	-40 ~ +85	°C
Storage Temperature Range	$T_{STG}$	-65 ~ +160	°C

Note: Absolute maximum ratings are those values beyond which the device could be permanently damaged. Absolute maximum ratings are stress ratings only and functional device operation is not implied.

Notes: 1. All currents into the device are positive; all currents out of the device are negative. All voltages are referenced to device ground unless otherwise specified.

2. All typical specifications are given for  $V_{CC}=5.0V$  and  $T_A=+25^\circ C$

3. Supply current specification is valid for loaded transmitters when  $DE=0V$

4. Applies to peak current
