

## FEATURES

- Fully compatible with the ISO 11898 standard
- Thermally protected
- ±58V BUS protection
- Driver (TXD) and standby bus (BUS) dominant overtime function
- Low-power standby mode with wake-up function
- SIT1042AQT/3 can be interfaced directly to microcontrollers with supply voltages from 3V to 5V
- Undervoltage protection on VCC and VIO power supply pins
- Timing guaranteed for data rates up to 5 Mbit/s in the (CAN FD) fast phase
- The typical loop delay from TXD to RXD is less than 100ns
- Very low ElectroMagnetic Emission (EME)
- Unpowered nodes do not interfere with the bus
- Provide DFN3\*3-8/ HVSON8, Small Outline, Leadless Package

## PRODUCT APPEARANCE

Provide Green and Environmentally Friendly Lead-free package

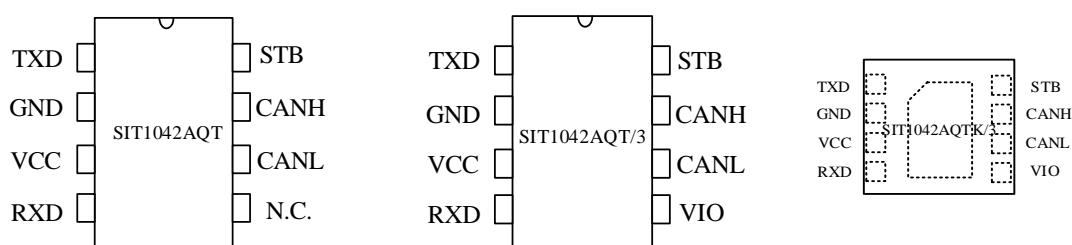

## DESCRIPTION

SIT1042AQ is an interface chip used between the CAN protocol controller and the physical bus. It can be used in trucks, buses, cars, industrial control and other fields. It supports 5Mbps (CAN FD), and has the ability to perform differential signal transmission between bus and the CAN protocol controller. The SIT1042AQ is an upgraded version of the SIT1042Q with improved bus signal symmetry and lower electromagnetic radiation performance. In addition, the SIT1042AQ is fully compatible with SIT1042Q.

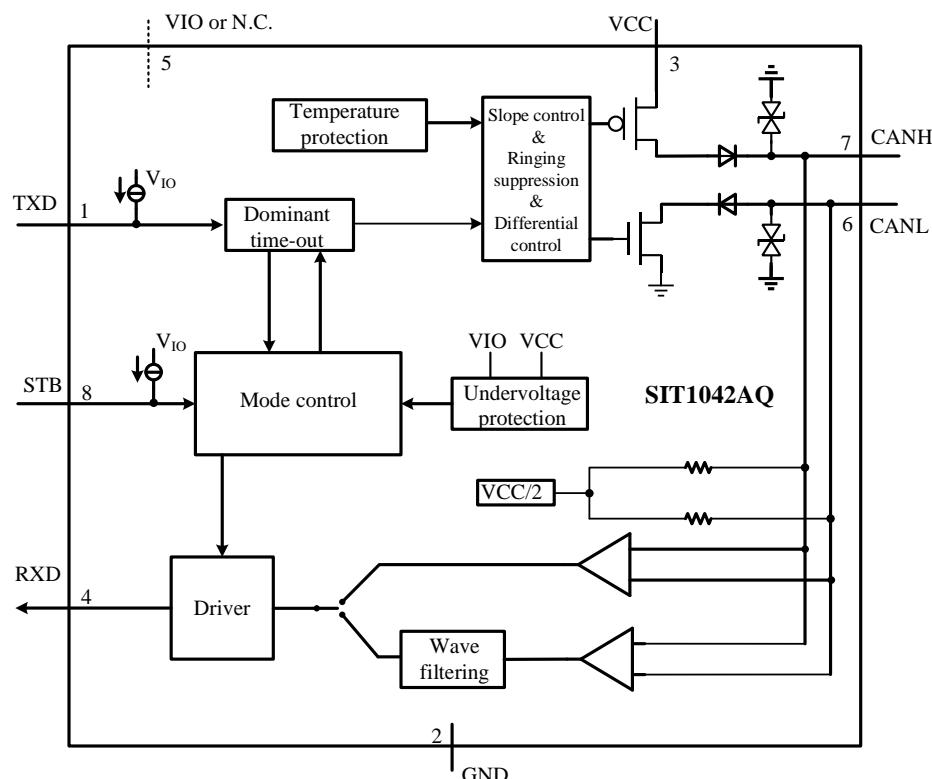

PARAMETER	SYMBOL	CONDITION	MIN.	MAX.	UNIT

**LIMITING VALUES**

PARAMETER	SYMBOL	VALUE	UNIT
<b>Supply voltage</b>	VCC	-0.3~7	V
<b>MCU side port</b>	TXD, RXD, STB, VIO	-0.3~7	V
<b>Bus side input voltage</b>	CANL, CANH	-58~58	V
<b>Bus differential breakdown voltage</b>	$V_{CANH-CANL}$	-27~27	V
<b>Storage temperature</b>		-55~150	°C
<b>Virtual junction temperature</b>		-40~150	°C
<b>Welding temperature range</b>		300	°C

The maximum limit parameters mean that exceeding these values may cause irreversible damage to the device. Under these conditions, it is not conducive to the normal operation of the device. The continuous operation of the device at the maximum allowable rating may affect the reliability of the device. The reference point for all voltages is ground.

**PINNING**

PIN	SYMBOL	DESCRIPTION
1	TXD	transmit data input
2	GND	ground
3	VCC	supply voltage
4	RXD	receive data output; reads out data from the bus lines
5	VIO	transceiver I/O level conversion power supply voltage (SIT1042AQT/3 version)
5	N.C.	no connection (SIT1042AQT version)
6	CANL	LOW-level CAN-bus line
7	CANH	HIGH-level CAN-bus line
8	STB	standby mode control input, low level is high speed mode

**ADDITIONAL DESCRIPTION****1 Sketch**

SIT1042AQ is an interface chip applied between the CAN protocol controller and the physical bus. It can be applied to trucks, buses, cars, industrial control and other fields. It supports 5Mbps flexible data rate (CAN FD) and has the ability to transmit differential signals between the bus and the CAN protocol controller. Fully compatible with ISO 11898 standard.

**2 Short-circuit protection**

A current-limiting circuit protects the transmitter output stage from damage caused by accidental short-circuit to either positive or negative supply voltage, although power dissipation increases during this fault condition.

**3 Over temperature protection**

The output drivers are protected against over-temperature conditions. If the virtual junction temperature exceeds the shutdown junction temperature  $T_j(sd)$ , the output drivers will be disabled until the virtual junction temperature becomes lower than  $T_j(sd)$  and TXD becomes recessive again.

By including the TXD condition, the occurrence of output driver oscillation due to temperature drifts is avoided.

**4 Undervoltage protection**

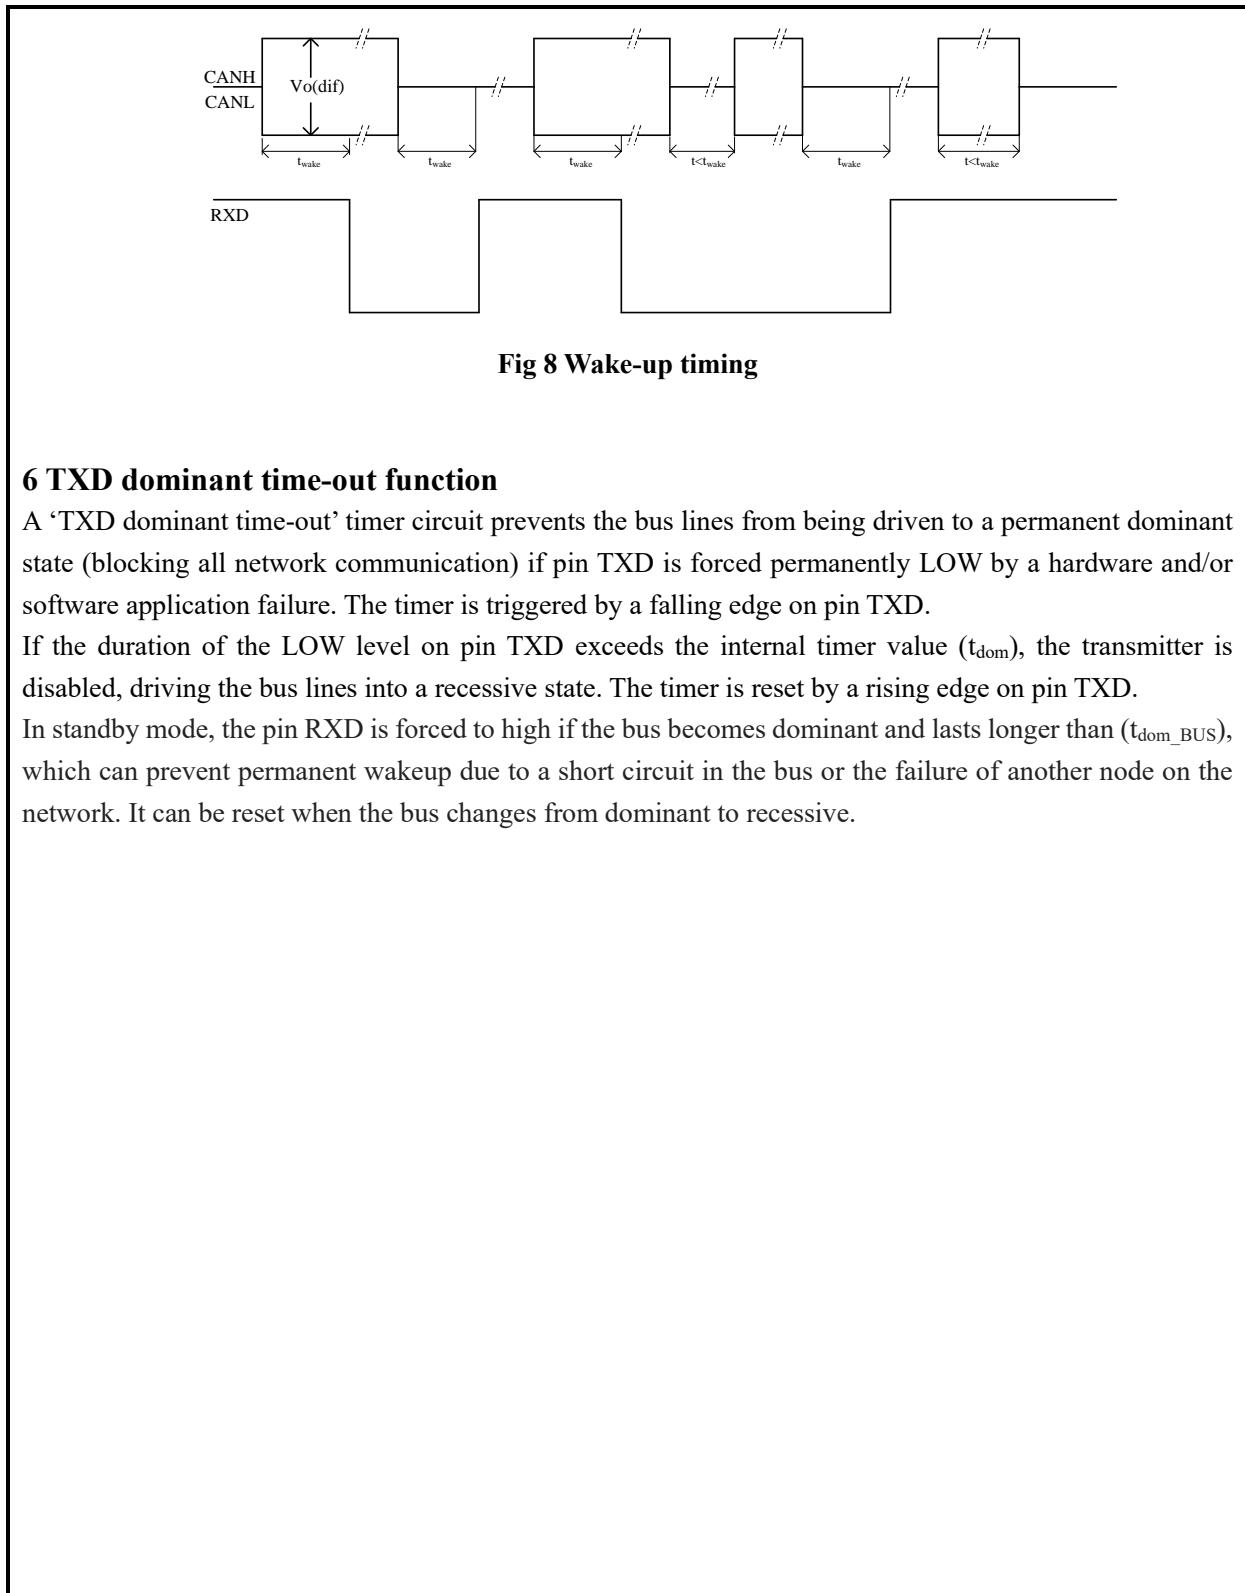

The SIT1042AQ power supply pin has an undervoltage detection function, which can put the device in a protected mode. This protects the bus when VCC is lower than  $V_{UVL\_VCC}$  or VIO is lower than  $V_{UVL\_VIO}$ .

**5 Control mode**

The SIT1042AQ provides two modes of operation which are selectable via pin STB: High-speed mode and standby mode.

High-speed mode is normal working mode, by connecting STB to ground to set the SIT1042AQ to high-speed mode. In this mode the transceiver is able to transmit and receive data via the bus lines CANH and CANL. The differential receiver converts the analog data on the bus lines into digital data which is output to pin RXD via the multiplexer (MUX).

Set pin STB to high level to activate low power standby mode. CAN driver and receiver are turned off to save system power consumption. A high level on the pin STB activates this low-power receiver and wake-up filter, and pin RXD becomes low once the low-power differential comparator detects that the dominant bus level of the  $T_{WAKE}$  is exceeded. (In SIT1042AQT/3, when the VCC is undervoltage or the VCC is open, the low-power receiver can still detect dominant and recessive level on the bus as long as the VIO is powered properly.)

**Fig 8 Wake-up timing**

## 6 TXD dominant time-out function

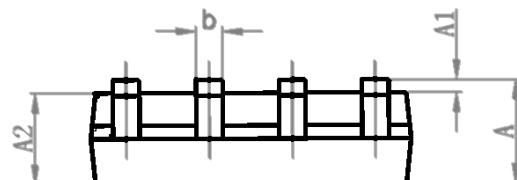

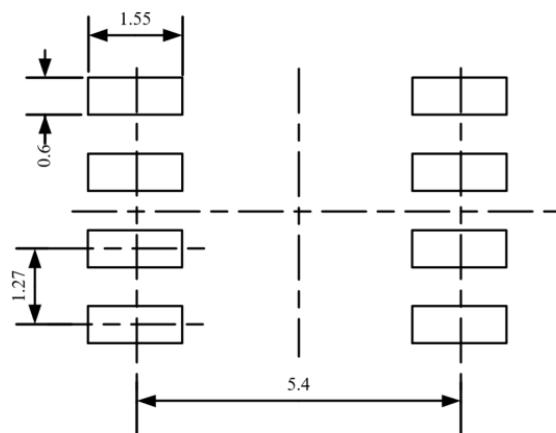

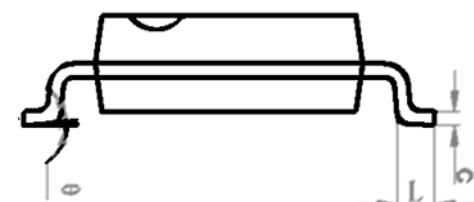

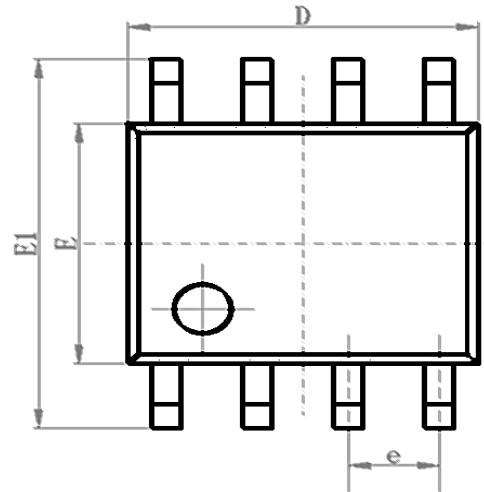

A ‘TXD dominant time-out’ timer circuit prevents the bus lines from being driven to a permanent dominant state (blocking all network communication) if pin TXD is forced permanently LOW by a hardware and/or software application failure. The timer is triggered by a falling edge on pin TXD.

If the duration of the LOW level on pin TXD exceeds the internal timer value ( $t_{\text{dom}}$ ), the transmitter is disabled, driving the bus lines into a recessive state. The timer is reset by a rising edge on pin TXD.

In standby mode, the pin RXD is forced to high if the bus becomes dominant and lasts longer than ( $t_{\text{dom\_BUS}}$ ), which can prevent permanent wakeup due to a short circuit in the bus or the failure of another node on the network. It can be reset when the bus changes from dominant to recessive.
